

Experiments

Below I have tried 1mm white flock to simulate snow and frost

The first picture shows a frosty effect on grass. I lightly brushed the tips of the grass with PVA glue then added 1mm white flock using the Flockbox

In the examples below

Firstly I tried a whole white base coverage but found that the white flock looked a bit translucent. I then tried painting the base white before adding flock, including the grass that was already on the base and got a far better looking snow base result.

I also tried making some self-adhesive snow patches on silicone paper. These came out better than expected but you can see they do not sit well over the top of green grass as you can see the base lifting slightly. They would be good over flatter ground with separate green grass tufts added afterwards in the gaps. The snow on the large bush was added straight on and is not self-adhesive tufts.

There is also another frosty effect base that gave good results; I like the longer branch which looks quite realistic.
